## Head & Base Form Configurations

## HEAD & BASE PANELS

These forms are used to form a bond beam at the top & bottom of Tilt Up Panels. Placed perpendicular to form panels with the 100mm extension against the timber edge form to tie the top and bottom integral beams.

Each rib void formed by the panels is extended through to the Head or Base Form by cutting out the deep part of the Head or Base form in line with the rib void.

Top anchor bolts can be pre placed in the timber to hold them in position during the casting of the panel.

Head and Base Form can be used with or SF Panels or Standard Panels and Beams.
